Topic: Option 2.1 MeTa Toolkit

Project Topic: Enhance MeTA and Metapy usability

The Metapy installation and usability took me more than 4 hours to figure out how to install a compatible version of python that I can use to complete the assignment in this course. My goal with this project is to create a system and a tutorial for installing and using the tool on different platforms that will help future students complete this installation and used the toolkits without feeling the same frustration I felt at the beginning of this class.

I will show how to set up an environment in the Windows and macOS operation system using anaconda and the latest Python versions to complete the different tasks and integrate the other popular toolkits. Also, I will create a system in python that will contain all necessities steps to install this environment and the different packages need it
